Thus, although the alternating duration of the cardiac action potential has a periodic dynamic, they are considered to be pathological rhythms related to the appearance of ventricular fibrillation.

It consists of two innovative introductory presentationson dynamical systems and fluid dynamics and six chapters on advancedresearch. Yamamoto in which the control distance is arbitrary. There is a continuous emphasis on conceptual issues often introduced via concrete examples.

Therefore, predictive control must be corroborated by an estimate of the size of the restricted attraction basin of the unstable fixed point. The suppression of the stable periodic orbit by predictive control requires a rigorous estimation of the control distance. The advantage of this mathematical approach is that it can be rigorously applied and the results validated not only to discrete multi-dimensional nonlinear chaotic systems logistics map, Hénon map but also in the case of the prevention of some cardiac pathologies using the action potential duration map APD , a nonlinear chaotic discrete dynamical system.

NONLINEAR DYNAMICS CHAOTIC AND COMPLEX SYSTEMS BY E INFELD

This book presents a unified view, adopting concepts from each of the disjoint fields of disordered systems and nonlinear dynamics. Special attention is paid to the glass transition, from both experimental and theoretical viewpoints, to modern concepts of pattern formation, and to the application of the concepts of dynamical systems for understanding equilibrium and nonequilibrium properties of fluids and solids.

Chaotic Dynamics Analysis for a Class of Delay Nonlinear Finance Systems

The present work consists of a generalization to dimensions greater than 1 of the results obtained on control and more precisely on the suppression of periodic rhythms in unidimensional nonlinear discrete dynamic systems. Special attention is paid to the glass transition, from both experimental and theoretical viewpoints, to modern concepts of pattern formation, and to the application of the concepts of dynamical systems for understanding equilibrium and nonequilibrium properties of fluids and solids.
