Neural network model reference decoupling control for single leg joint of hydraulic quadruped robot

A control design technique known as the Model Reference Neural Network MRNN method has recently been developed.

Create Reference Model Controller with MATLAB Script

Multiple neural networks are used to model the process and the model is then used in an NMPC scheme to control the process. Neural network is used to approximate value function to find approximate solution of HJB equation using least squares method.

Experimental tests of a model reference neural network controller on nonlinear servosystems

The rate of heat transfer from the jacket fluid to the vessel fluid is 1 Where H C is the overall heat transfer coefficient and A is the area for heat transfer.

Model Reference Adaptive Control of Jacketed STIRRED

Since the Plant Identification window is identical to the one used with the previous controllers, we won't go through that process here.

[PDF] Model reference neural predictive controller for induction motor drive

This process continues one segment at a time until the entire training set has been presented to the network.

CiteSeerX — Model Reference Neural Network Control for a Variable

From an extensive set of evaluation tests, which includes a control performance test, a disturbance rejection test, and a generalization test, the proposed SRNN-based MRAC system demonstrated its effectiveness with regards to precise control and good robustness and generalization abilities. The proposed controller guarantees controlled hydraulic system a semi-global asymptotic stability. In heater a hot fluid is circulated through the jacket which is assumed to be perfectly mixed.
