respectively. We further show that two genetic CHCHD10 disease variants, G66V and P80L, in the mitochondria exhibit faulty interactions with MNRR1 and COX, reducing respiration and increasing reactive oxygen species ROS, and in the nucleus abrogating transcriptional repression of ORE-containing genes.

Proteotoxic stress and circulating cell stress proteins in the cardiovascular diseases

The endoplasmic reticulum stress-inducible protein, Herp, is a potential triggering antigen for anti-DNA response. However, they also exist extracellularly and appear to act as inflammatory factors. This should provide a focus for future investigation.

Inflammation: The Common Pathway of Stress

Road to ruin: targeting proteins for degradation in the endoplasmic reticulum. However, when stress stimuli are prolonged or over exaggerated, in another word, chronically increased allostasis lead to pathophysiology. Upper, HEK293 WT and CHCHD10-KD cells bars 1 and 2 are each overexpressing an empty vector EV.
