## Coronary Heart Disease

Angioplasty in Women Procedures to open narrowed blood vessels and prevent heart attack involve inserting a catheter thin tube into vessels and passing a device tiny balloon through the tube to open the artery. Its strategies range from preventing people from getting heart disease to managing and treating those diagnosed with CHD.

## Acute Coronary Syndrome: Current Treatment

Although concerns have been raised, retrospective cohort studies and an RCT indicate no severe adverse events with varenicline in the setting of ACS patients, with the large EVITA trial in ACS ongoing.

## Clinical reality of coronary prevention guidelines: a comparison of EUROASPIRE I and II in nine countries. EUROASPIRE I and II Group. European Action on Secondary Prevention by Intervention to Reduce Events

Increasing fiber-containing whole plant foods. It promotes practice-based screening for risk factors and treatment based on risk, where appropriate Box 2. Diet and physical activity counseling during ambulatory care visits in the United States.

## 11 Ways to Prevent Coronary Artery Disease

Continuous positive airway pressure is the gold-standard therapy and reduces CV mortality and events.

## Primary Prevention Trial Designs Using Coronary Imaging: A National Heart, Lung, and Blood Institute Workshop

Coronary artery disease CAD is a pathological process characterized by atherosclerotic plaque accumulation in the epicardial arteries, whether obstructive or non-obstructive. B Fibrinolysis is not recommended for treatment in patients with NSTEMI-ACS. Healthcare providers must work with patients to decrease the disease burden in the US.

## **Clinician Guide to the ABCs of Primary and Secondary Prevention of Atherosclerotic Cardiovascular Disease**

The AHA suggests that physicians consider advising patients to increase dietary intake of omega-3 fatty acids to improve cholesterol levels, but a Cochrane review found insufficient evidence to recommend for or against supplementation. A meta-analysis of prospective cohort studies has shown that, on average, a 2% increase in energy intake from trans fatty acids increases CAD risk by 23%.
