Trichophyton

They are commonly found in the mucous membrane of the mouth and respiratory tract etc where they have been associated with a number of diseases and infections including sepsis, pneumonia, and pharyngitis. Numerous swollen giant forms of microconidia and chlamydospores are produced in older cultures. Morphological Description: Colonies are slow-growing with a flat to folded, suede-like surface.

Streptococcus Bacteria

Varying numbers of spherical chlamydospores, spiral hyphae and smooth, thin-walled, clavate-shaped, multicelled macroconidia may also be present. Occasional slender, clavate, smooth-walled, multiseptate macroconidia are also present in some cultures. While anaerobic Streptococcus bacteria have been shown to be part of the normal flora in the mouth, genital tract, skin, and genital tract, etc, a number of species are responsible for various infections that range from mild to severe.

Growth requirements of mycelial cultures of the mycorrhizal mushroom Cantharellus cibarius

In the case of Streptococcus pneumoniae, the synthesis of the peptidoglycan during propagation is suggested to occur through peripheral and septal systems. The work is part of the doctorate of S.

CAB Direct

Here, they have been shown to help in the decomposition of cellulose, alginates, and various hydrocarbons. As parasites, they cause harm to the host by causing diseases.

CAB Direct

Pure culture synthesis, host specificity and mycorrhizal compatibility with *Pinus radiata*. *Mycorrhiza*, 21 5 , 393-401.

Evaluation of mycelial inocula of edible *Lactarius* species for the production of *Pinus pinaster* and *P. sylvestris* mycorrhizal seedlings under greenhouse conditions, *Mycorrhiza*

Journal *Mycorrhiza* — Springer Journals Published: Dec 1, 2010 APA Parladé, J. The formation of rhizomorphs was related to colonization ability, but no relationship was found between colonization and formation of extraradical mycelium. Colonies are flat, white to cream, suede-like to downy with a deep wine-red reverse pigment.

Trichophyton

Apart from the soil, some of the species can be found in aquatic environments. All the seedlings inoculated with this strain were colonized although the colonization rates were relatively low. This chapter attempts to summarize current knowledge in order to present a starting point for further studies on members of this important genus.
