## Totality

Every five stars is well deserved. In about 500 to 600 million years, the Moon will appear too small in our sky for there to ever be another total solar eclipse on Earth again.

## Total Eclipse of the Sun as seen from Kentucky on April 8, 2024

The total phase began at sunrise in the North Pacific, with the path of totality sweeping through Oregon where the skies were, unfortunately, completely overcast, Washington, Idaho, and Montana, as well as most of central Canada and Greenland. It is very dangerous to look at the Sun through unfiltered telescopes, binoculars, cameras, and other optical devices.

## Total Solar Eclipse Science

The maximum eclipse will be observed near the cities of Nazas and Torreón, Mexico, where totality will last four minutes and 28 seconds. The Earth's umbra is not totally dark because of light scattered by the Earth's transparent atmosphere. The greatest totality duration along the path is an astounding 6 minutes and 22 seconds, occurring in Egypt near Luxor.

## Eclipse History: Total Solar Eclipses in the United States

This is the location where the total eclipse lasts the longest along the entire path.
