1. Introduction

The minimum mean length of generation and doubling time were 40. Biodiversity of predaceous Coccinellidae in relation to bioindication and economic importance. These observations show that colonies of various ant and bee species adjust and modify worker size variation and average size depending on factors such as colony size or food stores.

Their results suggested that larvae of native species face increased IGP following invasion by *C.* Different parameters are used to investigate this, the two most common being maximum lifespan or maximum longevity and an averaged estimate for the survival of the group members. Eggs are also vulnerable to predation by other predators e. Each arm of the olfactometer was connected to a cage containing the plants. The species is highly mobile and eurytopic, shows an inhibition in ovipositing in the presence of conspecific larval trails, which represents an adaptive advantage favouring increased egg dispersal and serves to lower the risk of offspring mortality due to cannibalism.
