Introduction and Atlas of Electrocardiographic Vector (Chinese Edition): Sun Ying Xian: 9787538175615: ne-x.uni.rf.gd: Books

No attempt is made to explain in detail the cause of the various changes seen or the mechanism of the various arrhythmias. Large epidemiologic studies as well as case reports have suggested that some patients with this pattern — especially those with ST-segment elevations involving the inferior, as well as the anterior, leads — carry a higher risk of sudden cardiac death due to ventricular fibrillation VF, even in the absence of other structural heart disease Wu et al.

Normal ECG findings are fully described, and helpful introductory information is included on the principles of electrophysiology. It also does not truly represent the center-of-heart potential due to the body parts the signals travel through. The atlas contains 18 and 22 different paced QRS integral map patterns obtained in patients with previous anterior or inferior myocardial infarction, respectively.

Review, which illustrates classic features of ERP. Journal of the American College of Cardiology. In addition, the ST-segment elevations are relatively dramatic when compared with the modest amplitude of the precordial lead QRS complexes.

The ST-segment elevations in the right precordial leads are a normal and expected finding in LVH; they likely represent a reciprocal change to the ST-segment depressions in V5 and V6. These smaller devices often rely on only two electrodes to deliver a single lead I. In 30—50 percent of cases, similar ST-segment elevations may be present in the inferior limb leads.

When added to Einthoven's three limb leads and the six chest leads we arrive at the 12-lead electrocardiogram that is used today.

Misdiagnosis is common, even among experienced electrocardiographers; unnecessary thrombolytic therapy or percutaneous angioplasty is often administered Tran et al. See for clues that can help differentiate anterior wall subendocardial ischemia unstable angina or non-STEMI from a true posterior wall STEMI. Also, notice that the ST-segments are elevated in leads V2 and V3; these right precordial ST-segment elevations are probably reciprocal to the ST-segment depressions in leads V5 and V6, which, in the setting of LVH, are actually posterior, as well as lateral, leads.

Chapter 6

Determination of rate and rhythm is necessary in order to make sense of further interpretation.
