## Stanford scientists: Climate change on pace to occur 10 times faster than any change recorded in past 65 million years

Stanford climate scientists warn that the likely rate of change over the next century will be at least 10 times quicker than any climate shift in the past 65 million years.

## Northern and southern hemisphere climates follow the beat of different drummers

The climate change brought by El Niño, which relies on winds and ocean currents, is an example of natural atmospheric changes. It could be due to the response of the climate to warmer conditions, since warmer air carries more water vapor, or it could be related to the interhemispheric temperature differences, or both, Friedman said in an interview. In Greenland, botanists are discovering some flowering plants are emerging earlier each year, but not the pollinating insects they rely on.

## Global Climate Report

The accelerated Arctic warming affects weather in the continental US and around the entire Northern Hemisphere by changing the temperature contrast between mid- and high-latitude parts of the globe.

## Examining the Viability of Planting Trees to Help Mitigate Climate Change

Hansen and colleagues found that a bell curve was a good fit to summertime temperature anomalies for the base period of relatively stable climate from 1951 to 1980. Temperature anomalies and percentiles are shown on the gridded maps below. By Bjorn Carey Courtesy of Stanford University The top map shows global temperatures in the late 21st century, based on current warming trends.

## **The Arctic Is Warming Much Faster Than the Rest of Earth**

Guterres: more ambitious national climate plans that will keep global warming to 1. Shorter term changes in climate, such as the Younger Dryas period shown in Figure 1c, was found to be related to how the formation of North Atlantic deep water and the resulting Conveyor Belt circulation has changed over time.
