Urban regions include several characteristics that can influence climate, including construction materials that absorb more heat than vegetation and soils do, impervious cover that minimizes the cooling effect of evapotranspiration, the canyon-like architecture of buildings that tends to trap heat, and heat generation from vehicle and building emissions. A reduction in per capita water consumption or a reduction in quantity allocated can aid in conserving existing water resources.

Land Cover Trends

Climate change is expected to directly and indirectly impact land use and cover by altering disturbance patterns, species distributions, and the suitability of land for specific uses. Although often effective at identifying areas of spectral change, these techniques typically result in the creation of a simple, binary change masks. Caribbean region and the U.

International Journal of Plant Sciences, 167 6 , 1123—1150. A dramatic example illustrated here is the large decline in agricultural lands in the two Great Plains regions beginning in the mid-1980s, which resulted in large part from the establishment of the Conservation Reserve Program. This has happened as a result of more efficient forest and agricultural management practices, but it is not clear if this rate of uptake can be increased or if it will persist into the future.
