HIV Case Reporting and Surveillance

Additionally, it is important for family physicians to recognize complications of therapy and potential medication interactions. For men and women, anorectal examination is important to evaluate for anal warts, other STDs, and anal cancer, with screening for prostate abnormalities in men as age appropriate.

HIV Case Reporting and Surveillance

HIV infection and bone disease. Providers should inquire about any surgical procedures as well as all chronic medical conditions such as peripheral neuropathy, gastrointestinal disease, chronic viral hepatitis, hyperlipidemia, diabetes mellitus, cardiovascular disease or risk, or kidney disease that might affect the choice of therapy or response to therapy.

Diagnosis and Initial Management of Acute HIV Infection

BMC Infect Dis 2018;18 1 :683. Retained in HIV care but not on antiretroviral treatment: a qualitative patient-provider dyadic study.

Human Immunodeficiency Virus (HIV) Infection

People with HIV also are at higher risk for loss of bone mineral density BMD, hypogonadism, and neurocognitive disorders. People receiving HIV testing should also be provided information on prevention, care, and treatment services including links to online resources when appropriate.

Primary Care Guidelines for the Management of Persons Infected With HIV: 2013 Update by the HIV Medicine Association of the Infectious Diseases Society of America

Persons infected through high-risk heterosexual contact represented 31 percent of new infections, compared with 12 percent for those infected through injection drug use. The complete series is 1 dose of PCV13 as a priming vaccine, followed by 2 doses of PPSV23 before age 65 years and 1 additional dose of PPSV23 after age 65 years.

Infectious Mononucleosis

Increasing HIV levels are the earliest evidence of treatment failure and may precede a decreasing CD4 count by months. To receive optimal medical care and achieve desired outcomes, persons with HIV must be consistently engaged in care and able to access uninterrupted treatment, including ART. At the present time, tropism testing is recommended for patients who are being considered for treatment with a CCR5 antagonist—containing antiretroviral regimen.
