

Effect of lighting regime and dietary energy level on male and female broiler chicken performance.

- - Effect of Adding Different Levels of Dietary Electrolyte in Broiler Rations using Sodium Bicarbonate as a Source of Electrolyte.

Description: -

-effect of lighting regime and dietary energy level on male and female broiler chicken performance.

-effect of lighting regime and dietary energy level on male and female broiler chicken performance.

Effects of different lysine and energy levels in diets on the performance and carcass traits of growing local Muscovy ducks

Revista Brasileira de Ciência Avícola 3:27-33.

Dynamics of gene expression of hormones involved in the growth of broiler chickens in response to the dietary protein and energy changes

Increasing the energy and protein density of diets for broiler chickens has given inconclusive results.

Feeding management of poultry

Increasing dietary energy at the same protein level can significantly increase body lipid accretion in the chicken. Newcombe et al 1992 found that there was 10% more abdominal fat in birds reared under an increasing lighting program 55. Dietary AME was increased by augmenting vegetable oil in the diet, with small adjustments to the amounts of sorghum grain and soybean meal to keep the levels of CP and other nutrients the same across diets.

Technological Options for Improving the Nutritional Value of Poultry Products

GENETIC SELECTION In the late 1970's, poultry researchers realized that the excess fatness of broiler chickens is a result of selection for fast growth rate. The present work did not show any effect of quantitative early feed restriction on broiler performance.
