Robust link prediction in criminal networks: A case study of the Sicilian Mafia

Young women tend to offer moral as opposed to instrumental rationales for stopping offending and were more likely to emphasise the importance of relational aspects of the process including parental attitudes, experiences of victimisation, the assumption of parental responsibilities and disassociation from offending peers.

Damned If You Do, Damned If You Don't

As far as we are aware, there are extremely few studies that have tested the effects of celerity or swiftness of punishment on reoffending. Positive results have also been reported for functional or behavioural family therapy, family empowerment and allied therapeutic approaches, especially when used with young people who have committed more serious offences. The Supreme Court, for example, has ruled that narco-analysis test findings are inadmissible evidence because they violate Article 20 3 of the Constitution.

Computer forensics investigation

Even malware has been used by law enforcement agencies to conduct surveillance in order to gather information about and evidence of cybercrime. Principle 3: An audit trail or other documentation of all processes applied to computer-based electronic evidence should be created and preserved. Holistic interventions for young offenders Young people who offend require holistic interventions.

What Works to Reduce Reoffending: A Summary of the Evidence

The example extends the principle to include data stored in computers and similar methods, of which increasing use in the public records area may be expected.

Computer forensics investigation

Before carrying out any further processes, we need to image the disk bit by bit, which will access the entire volume and copy the original media, including the deleted files.

Rule 901. Authenticating or Identifying Evidence

A number of studies have found that RNR assessment tools have greater predictive validity in demonstration projects than when used in practice.

Computer forensics investigation

This is in accordance with the findings of a number of research studies which have compared the reoffending rates of those serving community sentences against those serving short prison sentences. Initial results suggest that whilst the IAC group had lower levels of reoffending than those who served short court order, this result was not statistically significant. They followed up this hypothesis by designing and delivering such training, which involved structuring supervision sessions to adhere to RNR principles and include cognitive behavioural techniques.

Cybercrime Module 6 Key Issues: Handling of Digital Evidence

The authors suggest that programmes must be well implemented and that flexible mental health services should be made available for young people. Instead, a duplicate is made of the contents of that device and the analyst works on the copy.
