A new Synbranchus (Teleostei: Synbranchiformes: Synbranchidae) from ilha de Marajó, Pará, Brazil, with notes on its reproductive biology and larval development

One of these morphological characters is the possession of a small supramaxilla

Filesize: 47.75 MB

character 25 0 found in echeneoid and trachinotine taxa examined. After passing through the first stages of development in poorly oxygenated waters, the rainy period starts soon after late November or December and the juveniles reach oxygenated and flowing water. Reproduction of the east African lungfish Protopterus aethiopicus Heckel.

jmbfs_894_hilles

Cladogram restricted to only the Carangiformes and Synbranchiformes.

① **Macrotrema caligans is a species of swamp eel native to Peni**

An additional morphological character supporting this sister-group relationship is a prominent anterodorsal expansion of the parasphenoid found in all polynemids and flatfishes examined character 8 1; A—C. Following a discussion of the historical placement of groups based on morphological and molecular data, we will then discuss some of the morphological features that support the relationships we recover. Elasmoma: another look, In: Abstracts of the 77th ASIH annual meeting, University of Washington, Seattle.

Phylogeographic Diversity of the Lower Central American Cichlid *Andinoacara coeruleopunctatus* (Cichlidae)

Bulletin of the British Museum Natural History , zoology, 58: 37—52. Due to the unresolved relationship among the major clades in , our analyses focused on the general time of divergence among these clades rather than the detailed timing of divergence within clades see Supplement S1E for more information on these results.

Phylogenetic classification of bony fishes

We ran four independent Bayesian analyses for 1,000,000 generations with 4 Markov chains sampling every 100 generations using the GTR+I+G model. Such molecules play a role in the regulation of many protein syntheses Aoyama, 1989, 1990. In 1995, Mooi and Gill refuted the homology of this character, noting that the second neural spine of *Centropomus* is broadly expanded over most of its length while the second neural spine of latid species is not closely applied to the first neural spine and is only expanded proximally.

Characterization of the hemoglobins and globins of *Synbranchus marmoratus* Bloch, 1795 (Pisces, Synbranchidae)

After in-vitro evaluation for eel skin mucus activities, identification study using liquid chromatography-quadrupole-time-of-flight mass spectrometry LC-QTOF-MS was performed to investigate the compound responsible for the anti-oral pathogens activities, the results showed the presence of salvianolic acid G which strongly correlated with the antimicrobial activity against selected oral pathogens.
