Mental Status Exam (MSE) — Factors and Definitions

The mini-mental state examination is a simple structured cognitive assessment which is in widespread use as a component of the MSE. Often, a patient's thought process can be described in relation to a continuum between goal-directed and disconnected thoughts. The words make sentences, but the sentences do not make sense.

Mental status examination

Clothing and accessories of a particular subculture, , or clothing not typical of the patient's gender, might give clues to. Focal neurological signs such as these might reflect the effects of some prescribed psychiatric medications, chronic drug or alcohol use, , or other brain disorders.

Mental status examination

Assessment of patients' competence to consent to treatment. There may be associated hostility and competitiveness. Additional descriptors include whether thoughts are logical, tangential, circumstantial, and closely or loosely associated.

Mental Status Exam (MSE)

The mental status examination is an essential tool that aids physicians in making psychiatric diagnoses. Delusion is not seen in: A. It might be described as without association, a flight of ideas, rapid thoughts, tangential, circumstantial, word salad, derailment, neologism, clanging, punning, thought blocking, or thought poverty.

A Glossary of Psychiatric Terms

Cosmetic Other disorders of perceptions are Hallucinations and Illusions.

Mental Status Examination

Psychiatric, medical, social, and developmental history is also reviewed. This article will use the Trzepacz and Baker 1993 definitions, with mood

regarded as a current subjective state as described by the patient, and affect as the examiner's inferences of the quality of the patient's emotional state based on objective observation. Many of the visual effects of are more correctly described as visual illusions or visual pseudohallucinations, as they are distortions of sensory experiences, and are not experienced as existing in objective reality.
