However, in all cases very high purity and crystal perfection is necessary for efficient semiconducting operations and to produce the material, zone-refining techniques are used. Free ridership, on the other hand, are program participants who would have adopted DSM without the program, but nonetheless participate in the program.

For practical applications, there are five parameters that are commonly used to judge the TFT's performance: on current I_{on} , off current I_{off} , field-effect mobility μ_{eff} , threshold voltage V_{th} , and subthreshold slope S . High currents and high ambient temperatures have a disastrous effect on the aging process.

In North America, it is expected to fall by 77%. This weakens the overlap integrals of the orbitals on the different atoms, and so reduces the energy hybridization resulting from the overlap.
