15.2: Sponges and Cnidarians

Cubozoans are anatomically similar to the jellyfish. HR A hermit crab and invertebrate. A type of asexual reproduction found only in freshwater sponges occurs through the formation of gemmules, clusters of cells surrounded by a tough outer layer.

Other Invertebrates (corals, sponges, worms, etc.)

A tiny and very dangerous Portugese Man-O-War jellyfish *Physalia physalis* has a small disc like body and floats freely in the water column. The flexibility of these layers and re-modeling of the mesohyl by lophocytes allow the animals to adjust their shapes throughout their lives to take maximum advantage of local water currents. The mesohyl contains embedded amoeboid cells that secrete tiny needles called spicules or protein fibers that help give the sponge its structural strength.
