## Role of Judiciary in Environmental Protection

Levels of investment Transport for Quality of Life have called for a £2 billion a year investment in cycling infrastructure. With some possible exceptions, open-cut methods usually provide coal at a lower overall cost than underground mines; they also avoid some of the safety hazards, such as roof falls, gas outbursts, and coal-dust explosions, that can occur in the underground mining environment.

## Difficult Situations at Work

In the Coasean analysis, rights are to be assigned to formalize a presumptive rights regime, and the issue involves selecting to whom the property rights should go. Incentives such as tax credits, national regulations that prioritize clean energy feed-in before fossil fuels, grant schemes, and low-interest loans all have the potential to help poorer people gain access to modern and clean energy solutions, and they can encourage both domestic and foreign investors to develop and promote renewable energy technologies across different types of users and different markets.

## Land Use Conflict

ADVERTISEMENT SEPs, which have been used for roughly three decades in environmental cases, allow companies to take actions like cleaning up streams to lessen any fines they may have to pay for environmental violations.

## Polluter pays principle

Regarding the biological resources, forestry, watershed management, protected areas and oceans the Plan provides for different actions to be taken.

## Difficult Situations at Work

Sustainability criteria for biofuels and biofuel supply chains and proper certification schemes could be useful instruments to stimulate the development of advanced biofuels and sustainable land-use management, especially across the most vulnerable regions. The precautionary principle is one of these principles.
