Although the sample size could offer a partial explanation for this discrepancy, results were similar in male populations, and previously reported results were based on smaller sample sets. These observations lend credence to reports of unreliable spawning and limited egg production during thermal induction.

Influence of environmental variables and reproduction on the gonadal fatty acid profile of tropical scallop *Nodipecten nodosus*.

Sunray Venus Clam Resources

Collectively, these results indicate that male sunray venus clams could be considered fall to winter spawners, as Haines 1975, 1976 had indicated previously, but females exhibit disparate spawning patterns, which may be a consequence of environmental or dietary variability. Whether you need an overview of The Go-Getter or a detailed summary of the book for a college project or just for fun, brings you the book-wise summaries of The Go-Getter for free.

The effect of algal and artificial diets on the growth and fatty acid composition of *Crassostrea gigas* spat. Although palmitic acid 16:0 was the dominant SFA, 1-day-old larvae had the highest concentrations, whereas postset had higher levels of 14:0 and 18:0. The objective of this study was to determine the relative effects that temperature and diet have on the natural gametogenic cycle of this species so that improved conditioning protocols can be established for this species.

Fatty acid composition of adult and larval sunray venus clams *Macrocallista nimbosa*: Environmental and gametogenic impacts.

Total FAs and FA composition have been shown to follow a seasonal cycle related to the gametogenic cycle in bivalves DeMoreno et al.
