Concrete Modelling & Material Behaviour

The thermal expansion strain versus low temperature or prestressing level relationships were reported. Transit Linear Expansion Coefficient of Steel Strand The transit linear expansion coefficient was used to describe the thermal expansion at certain time point.

Ultimate strength behavior of prestressed concrete beams at cryogenic temperatures

At each prestressing level, the coefficients of thermal expansion under different temperature levels were tested. The test results indicated that at cryogenic temperatures, the plane section assumption for the prestressed RC beams under bending still worked, and the appearance of cracks can still be delayed by prestressing.

Bending behavior of prestressed

The Concrete Modelling and Materials Behaviour group focuses on the modelling and design of cement-based materials for the use in concrete structures. The logarithmic transformations on Eqs. In addition, the effects of radiation and moisture migration are discussed.
