Hallmarks of cancer: the next generation. Among the many cancer drugs that have been developed, synthetic lethality is one of the most important concepts first introduced by Bryant et al.

Encyclopedia of Cancer

Angiogenesis is an important driver of EOC development and progression and it is a main target of antitumor therapy. The role of CTCs in treatment failure and disease progression can be explained by their relation to biological processes, including the epithelial-to-mesenchymal transition and 'self seeding', defined as re-infiltration of the primary tumor or established metastasis by more aggressive CTCs. The HIF-1 complex targets a consensus hypoxia response element in the promoter of several pro-angiogenic genes, in particular VEGF, activating their transcription.

Pancreatic Cancer Metabolism: Molecular Mechanisms and Clinical Applications

Histone deacetylases induce angiogenesis by negative regulation of tumor suppressor genes.
