Also the demand for natural gas for the generation of electric power and for home heating purposes has gone up sharply. The record is age constrained via the identification of 15 independently dated tephra markers from terrestrial archives, circumventing marine reservoir age variability problems. The absence of this mollusc association at the fiord head suggests that the suspension-feeding molluscs that constitute this association, such as *Astarte*, *Hiatella*, *Mya* and *Trichotropis*, are intolerant of the lowered salinities and high suspended-sediment concentrations created by the discharge of Expedition River into the fiord-head environment.

Moreover, once laws or theories are established in this way, there is a basis for explanation or prediction by means of deduction. We have seen how records of changing surface wetness in raised mires constitute an important palaeoclimatic record Figure 320.

Furthermore, proxies for primary productivity were influenced by both cycles, although the Suess cycle exerts dominant control, reflecting a

stronger influence of upwelling on primary productivity. It was also this institute which stimulated the hydrogeological investigations by the Zuyder Zee Works.
