## Surface weather observation

The temperature at Pokegama Dam MN plunged to 59 degrees below zero to establish a state record. For 3-h observations, 67% of the errors were typographical in nature. However, in the absence of an adequate network of adjacent sites, the temporal and between-variable checks independently provide a fairly rigorous assessment of the quality of hourly wind data.

## OHD/HL

In the east, relative humidity is near 84%, and the dew point is near 10 degrees.

## How to compute the frequency of hourly/daily observation?

Dan Wilks for his insightful comments and to two anonymous reviewers for their constructive comments.

## ESSD

The sparse and biased spatial distribution of observation stations make it difficult to match the high degree of landscape heterogeneity over the TP. Precipitation totals by climate division, West 0.

## Dataset Overview

Highs in the lower 20s.

## IEM :: Download ASOS/AWOS/METAR Data

A 2-h difference is used to calculate D max 2 to avoid flagging valid wind shifts associated with frontal passages. Unauthorised use and or duplication of the material contained on this blog without permission from this blog's author is strictly prohibited. Prior to 1964 the longest constant wind direction period lasted 77 h at John F.

## **Dataset Overview**

In addition to a higher density of point observations areal estimates of these and remote sensing data would be available from the CSEs to examine some of the scaling issues associated with land surface models.

## **Dataset Overview**

The variations in sensible heat flux Fig.
