## Analysis of future drought characteristics in China using the regional climate model CCLM

According to USDA , 50 percent or more of the topsoil was rated short or very short of moisture dry or very dry in Rhode Island 85% , California 80% , Connecticut 69% , Oregon 65% , Oklahoma 64% , Alabama 63% , Arkansas 57% , Washington 56% , Texas 53% , New Mexico 51% , and Nevada 50%. The drought events lasting for 1—2 months would be decreased by 7.

## Climate change enhances the severity and variability of drought in the Pearl River Basin in South China in the 21st century

Phil van Mantgem and his collaborators are using plot-based methods to describe change and vulnerability to drought in the forests of the western United States. More frequent drought events of longer duration are projected in the southwestern river basins.

## Drought in the Southwest, 1942

In downstream areas the surface and ground-water resources are replenished not only by local precipitation but also by outflow from the headwaters areas; thus the effects of drought upon those water resources are complex and may be vague and indeterminate. Some large rainfall events affected parts of the region before widespread dryness spread across the Midwest in the latter part of the month.

## Drought in Nevada

Rhode Island saw only 21 percent of normal rainfall, making it the 2nd driest September on record. In the former case, impacts included the failure of 86,400 hectares of maize crops.

## Drought in the Southwest, 1942

. Tropical rains can help to fill water-supply reservoirs and provide long-term drought insurance.
