Distributed Database MCQ with Answers

What is the difference between the Database and Distributed Database Centralized? These systems are very robust and provide distributed transaction processing, distributed query optimization, and efficient management of resources.

Distributed Database Management System (DDBMS)

We require a DDBMS to have at least one global application. Information may or may not be accessible to other users depending on the design of the network.

Distributed Database MCQ with Answers

These objects belonging to a distributed database system . Only those data manipulation operations that require data not on site will be delayed.

Difference Between Distributed Database and Centralized Database

The data is centralized, even though other users may be accessing the data over the network, we do not consider this to be a distributed DBMS, simply distributed processing. The centralized database should be able to satisfy all the requests coming to the system. Example of Global Object Name Resolution: Partial Object Name This example illustrates how Oracle resolves a partial global object name and determines the appropriate path to the remote database using both a private and public database link.

Distributed Database

A remote transaction contains only statements that access a single remote node. An autonomous homogenous environment is which of the following? The same DBMS is used at each location and data are distributed across all nodes. Therefore, Oracle now searches for a matching public database link.

Distributed Database MCQ with Answers

In a distributed database, Oracle must coordinate transaction control over a network and maintain data consistency, even if a network or system failure occurs. Although Oracle permits you to manage each database in a distributed database system independently, you should not ignore the global requirements of the system.

Distributed Database System

So that we can use data in a cost-effective manner. Remediate patch and fix existing custom and packaged software to correct any two-digit date issues in the code; or 2.

Distributed Database System

Sites may not be aware of each other and may provide only limited facilities for cooperation in transaction processing. In other words, eXtremeDB databases can be all-in-memory, all-persistent, or have a mix of in-memory tables and persistent tables. What is the performance overhead due to model maintenance? Also, giving users more privileges than they need violates the fundamental security concept of least privilege: users should only be given the privileges they need to perform their jobs.
