MATHEMATICAL MODELS OF DISTRIBUTION OF SEDIMENT CONCENTRATION

The model was based on basic principles of physics and chemistry that describe the stages occurring in the desalination process. Empirical model for estimating vertical concentration profiles of re-suspended, sediment-associated contaminants. Each rainfall pattern was divided into three 30-min stages.

Pharmacokinetic models

Frauenfeld reported that rainfall intensity patterns had no effect on the total runoff or infiltration, but the total erosion associated with variable rainfall was significantly greater than that associated with uniform rainfall. In the initial stages of rainfall, soil erosion results mainly from raindrop strikes, which increase in strength with increasing intensity of the rainfall. Structural factors of turbulent flow over smooth and rough boundaries.

These measurements revealed a clay, silt, and sand content of 3.

Velocity and concentration profiles in uniform sediment

Pal, Koeli Ghoshal and Satya P. Several studies have, through artificial and natural rainfall, studied the mechanism of rainfall erosion.
