Rare earths: resource distribution and production, reserves, supply and demand

The Itataia deposit in Brazil is marble-hosted phosphate. Where phosphoric acid is produced, uranium is sometimes extracted as a by-product, for example, in Florida. Data are presented from 16 economically mineralized occurrences in North America and China, plus 5 subeconomically Mo-mineralized and 4 barren occurrences in North America, Norway and China.

Classification of uranium deposits

Several steps of sample preparation, radiochemical separation and source preparation were performed before analysis. They are distributed mainly in China 55 million tonnes, the United States 13 million tonnes, India 3. The reserves are distributed mainly in Inner Mongolia, Jiangxi, Guangdong, Sichuan and Shandong provinces, whose total rare earth resources account for 98% of the overall figure in China.

Classification of uranium deposits

Quartz-pebble conglomerate uranium deposits occur in conglomerates deposited in the range 3070-2300 million years ago.

Rare earths: resource distribution and production, reserves, supply and demand

Because melt inclusions preserve original metal- and volatile contents they are very helpful to reconstruct the abundances and evolution of these constituents in magmas. Proponents of lunar bases and future lunar colonies have long pointed to many of the moons minerals, along with water, as being useful to support such efforts.

Geology of Uranium Deposits

It provides users reliable information and knowledge to the greatest extent.
