First Example An example of a Thermodynamic Table calculation follows in which the user makes use of the ChemDraw program to enter the needed Benson groups into CHETAH. However, all these methods have limitations. Calculations were made as to the amount of an inert compound required to maintain certain mixtures as non-reactive hazards.

#### Cheikha

A small sender and receiver combined with such a micro-speaker is enough to communicate with someone.

#### **CHETAH**

When looking at the database composed of one-half sensitive compositions and one-half insensitive compositions, the overall energy release evaluation indicator will only incorrectly identify a sensitive composition as being insensitive in about 5 percent of the test cases. The maximum enthalpy of decomposition.

#### **CHETAH**

CHETAH is a unique tool for predicting both thermochemical properties and certain reactive chemical hazards associated with a pure chemical, a mixture of chemicals, or a chemical reaction. These authors were able to predict the proportions of certain waste chemicals that when combined will yield or not yield a reactive hazard.

For the sample molecule in , the groups that make up the molecule are indicated. CHETAH is used routinely by a number of chemical and pharmaceutical companies to predict the potential for deflagration or detonation of a pure chemical or a mixture of chemicals as a part of their hazard evaluation process for the synthesis of new chemicals and for reactor designs.
