# Development of design rules for structural adhesive bonded joints - a systematic approach.

## [s.n.] - On the Design of Interference

#### Description: -

- -Development of design rules for structural adhesive bonded joints a systematic approach.
- -Development of design rules for structural adhesive bonded joints a systematic approach.

Notes: Summary in Dutch.

#### Characterisation of High Accuracy, Feedback Controlled, Adhesive Bonding

The significance of parameters is determined for the preset confidence level of 95% i.

#### Development of design rules for adhesive bonded joints

Obviously, the limit state function G depends on the applicable type of resistance capacity, such as the bending moment requirement given the serviceability limit state or ultimate limit state of a beam. During training, the activation functions correspond to the hidden layer was log-sigmoid function, whereas linear activation function is used for both input and output layers. Contrary, if current iteration resulted in higher error values than the previous one, then it follows the error-backpropagation algorithm till to obtain the appropriate curvature for quadratic approximation and for this situation,  $\mu$  should be increased.

### Characterisation of High Accuracy, Feedback Controlled, Adhesive Bonding

This conflict might be the possible reason for the significant variation of resistance factors of the models discussed in Shi et al. Budhe S, Banea MD, De Barros S, Da Silva LFM 2017 An updated review of adhesively bonded joints in composite materials.

#### Development of design rules for adhesive bonded joints

Factors and parameters likely to be influential like surface treatment prior to bonding, the bonded length, the glass transition temperature T g of the adhesive, the exposure to aggressive environment, the temperature at service and different types of loading were examined.
