Surgical Treatment of Atrial Fibrillation

AF is currently classified as either lone or recurrent AF. Few cardiac surgeons were willing to add the procedure to a coronary revascularization or valve procedure because of its complexity and technical difficulty. It is predicted that the number of Americans diagnosed with AF will grow to more than 10 million by the year 2050.

Permanent AF includes cases of long-standing disease longer than one year, in which cardioversion has not been indicated or has failed to convert the arrhythmia.

Advantages of radiofrequency include improved safety, speed, minimization of bleeding, and real-time assessment of lesion thickness. The Cox-Maze IV procedure is a complex surgery, and its success depends critically on correct execution. Historical evolution and current available surgical treatment options are described, beginning from the first pure surgical maze, going through all its modifications in source ablation energies and lesion sets and finishing with current mini-invasive hybrid treatment of lone atrial fibrillation.
